[DETAILED EXPLANATION OF INVENTION]

[0001]

[TECHNICAL FIELD]

The present invention relates to novel heterocyclic compounds having inducing activity for biosynthesis of interferon. The heterocyclic compounds of the present invention induce biosynthesis of endogenous interferon in a living body, and are useful for medicines, such as antiviral agents, anticancer agents and therapeutic agents for immunologic diseases.

[0002]

[BACKGROUND OF THE ART]

It has been recently cleared that endogenous interferon plays not only central role to bio-defensive mechanism against virus infections and microbial infections, but also important role on antitumor and immune modulator. Mass production of interferon is established. Namely, it is possible to be available of natural interferon by cell culture and also to produce a large amount of recombinant interferon from E. coli transferred with a gene of interferon and therefore, many research achievements on

these interferons have accumulated. For example, many kinds of biological activity on interferon, such as antiviral activity, prevention of cell growth and immune modulation have been confirmed and interferon is practiced on clinics as treating agents for virus infected diseases, such as hepatitis C and hepatitis B, anticancer agents and therapeutic agents for immunologic disease. Furthermore, it is suggested that interferon will prevent carcinogenesis by hepatitis C and hepatitis B.

Since there is no therapeutic method for almost of the above diseases, interferon is especially made much of.

[0003]

[PROBLEM TO BE DISSOLVED BY INVENTION]

The object of the present invention is to provide novel low molecular compounds having inducing activity for biosynthesis of interferon, and interferon inducers, antiviral agents, anticancer agents and therapeutic agents for immunologic diseases comprising these compounds as active ingredients.

[0004]

[MEANS FOR SOLVING PROBLEM]

Viruses of many kinds of animals, microbes such as mycobacteria and protozoa, extracts of them, mitogen, specific antigens and immunopotenciators are known as inducers for biosynthesis of interferon. It is known that

for example, many kinds of natural double strand RNAs, synthesized double strand RNAs such as poly-I:C, and anionic high molecular compounds such as polyacrylic acid and oxyamylose oxidized with chlorite have inductive activity of interferon.

On the other hand, among low molecular compounds have been found fluorenones, pyrimidine derivatives, anthraquinones, acridines and so on having inductive activity of interferon (Stringfellow, D. A.: Methods in Enzymology, 1981, 78, 262).

However, when these compounds are used in clinical trial, their inducing activity of interferon is unexpectedly low and these compounds have side effects or by administering them repeatedly, their inducing activity of interferon decreases and therefore, development on these compounds have not succeeded. Furthermore, imidazoquinolines are known as interferon inducers among low molecular compounds. However, it is known that these compounds are inferior in selective interferon inducing activity and simultaneously induce cytokines such as IL-6, TNF- α , etc (Testerman, T. L., et al.: J. Leukocyte Biol., 1995, 58, 365).

[0005]

As the result of extensive investigation of interferon biosynthesis inducers among low molecules, the present

inventors have found that the heterocyclic compounds of the present invention have excellent interferon biosynthesis inducing activity.

[0006]

[0017]

Furthermore, the present inventors have found that the heterocyclic compounds of the present invention inhibit production of cytokines, such as interleukin 4, interleukin 5, interleukin 10, interleukin 13, etc., on the side of

type 2 helper T cells (Th2). Th2 is made much weight as allergic reaction-controlling cells, since Th2 produces many kinds of cytokine relating to allergic reaction. For example, IL-4 induces production of IgE antibody to B cells and induces expression of VCAM-1 gene, an important molecule, which functions when eosinophilis adheres to blood endothelial cells and penetrates the tissue. Recently, IL-4 has been also paid attention to as a differentiation growth factor. For example, IL-5 induces differentiation, growth, migration and activation of eosinophilis and therefore, it is considered as a factor initiating allergic inflammatory reaction. Accordingly, Th2 makes important role for controlling two types of allergic reactions, immediate type reaction participated by IgE antibody and mast cells and delayed type reaction participated by eosinophilis. Namely, allergic diseases is said to be the state in which Th2 is pathologically promoted. Promotion of production or existence of Th2-type cytokines such as IL-4, IL-5, etc., was confirmed on the air way or skin, allergic legion and therefore, it is paid attention to that to control the activation of Th2 is important for controlling allergic diseases (Rinsho-i (1994) 20:40-46). It is speculated that in the diseases of production of antibody such as systemic lupus erythematosus and autoimmune diseases abnormally promoted in humoral

immune, Th2 is in state pathologically progressed in its function (Medical Immunology (1988) 15:401). To make normal state or almost normal state by controlling the state in which Th2 is abnormally promoted is to make possible to be useful for therapy and prophylaxis of allergic diseases caused by abnormal promotion of the function of Th2, for example ashema (e.g. atopic ashema, non atopic ashema), allergic dermatosis, allergic rhinitis, systemic lupus erythematosus and AID.

Example 16Inducing activity for biosynthesis of interferon

1. Experimental method

1) Animals

C3H/HeJ male mice (5-8 weeks) were purchased from Clea Japan Inc.

2) Reagents

MEM (Osaka University, Microbial Research Center), FCS

(GIBCO Co. or Filtron Pty Ltd.), DMSO (Nacalai Tesque Inc.)

3) Test compounds

About 1mg of each test compound was accurately weighed and was dissolved in dimethyl sulfoxide (DMSO) to prepare 1mM or 10mM solution of the test compound. The solution was further diluted 500 times with a culture medium (MEM+10%FCS) and the obtained solution was used as the sample solution in the following tests.

4) Preparation of spleen cells and supernatant of the cell culture medium

After pre-feeding for a week, spleens of 2 or 3 mice were removed. The spleen was put in PBS(-) solution and a homogenous cell suspension was prepared by pipetting cells from the spleen. The cell suspension was centrifuged (1200rpm, 5min., 4°C) to remove the supernatant. Thereto was quickly added 0.2% ice cold NaCl solution (4ml) under ice cooling to make a suspension. After 30 seconds 1.6% (4ml) ice-cold NaCl solution was added to the suspension and the mixture was centrifuged to remove the supernatant. The residue was suspended in PBS(-) solution (10ml) and the suspension was centrifuged to remove the supernatant. The residue was suspended in 10ml of the culture medium (MEM+10%FCS) and the suspension was further centrifuged to remove the supernatant.

Then, the residue was suspended in 5ml of the culture

medium to control the viable cell number (2×10^6 cells/ml by trypan blue-staining). Thus obtained controlled cell suspension was poured into a 24-well plate (0.5ml/well) and the sample solution (0.5ml) was added to each well (0.5ml/well) and the plate was incubated (37°C , $5\%\text{CO}_2$) for 24 hours. After filtration (0.22 μm) of the supernatant of the culture medium, the filtrate was kept at -20°C as a bioassay sample.

5) Quantitative assay of interferon α in the supernatant of the culture medium

Immediately after L cells (Dainippon Pharm. Co.) cultured in monolayer culture were treated with trypsin, the cells were added to the culture medium and the cell suspension (4×10^5 cell/ml) was prepared by pipetting. Each 100 μl of the cell suspension was poured into all wells of a 96-well plate (Sumitomo Bakelite Co.) and the plate was incubated (37°C , $5\%\text{CO}_2$) for about 6 hours.

Standard mouse interferon (prepared by Lee Bio Molec. Res Co.) which was diluted by serial dilution method with a dilution plate and the above bioassay sample were poured into an assay plate (each of 50 μl). On the other hand only the culture medium (50 μl) was added to the uninfected cell control group and to the virus infected cell control group, respectively.

After incubation for 18 hours, the culture medium in

the assay plate was removed. A solution containing bovine vesicular stomatitis virus [after cloning virus (3.7×10^8 PFU/ml) distributed by Domestic Animal Research Institute with BHK cell, the original solution was diluted 300 times] was poured into all of wells (100 μ l/well) except the virus uninfected control group. On the other hand, only the culture medium (100 μ l) was added to the virus uninfected control group.

After incubation for about 48 hours, the virus solution on the assay plate was removed by suction. A dye solution (neutral red) was poured into all wells (50 μ l/well). After incubation for 45 minutes, the dye solution was removed by suction and the wells were washed with PBS(-) solution.

After removal of the PBS(-) solution, UV was irradiated for 10 hours to inactivate the virus. A mixture (100 μ l) of 0.1M NaH_2PO_4 and 99.5% ethanol (1:1) was poured into each well and the plate was stirred by a mixer for about 5 minutes. After that, the absorption at 540nm was measured with a plate reader.

6) Result of measurement

The result was shown in Table 4. The compounds of the present invention have inducing activity for biosynthesis of interferon.

Example 17Activity on cytokine production from mouse lymph node cells

[Experimental Method]

1) Animals

BALB/c female mice were purchased from Japan Charles River (Yokohama) and female mice (8 weeks) were used.

2) Culture medium

RPMI1640 medium "DAIGO" (Nippon Seiyaku (Tokyo)) supplemented with 10% heat-inactivated (56°C, 30min.) Fetal Bovine Serum (characterized Code No. A-1115-L, HyClone Lab., Logan, Utah) and 50mM 2-mercaptoethanol (Sigma, St. Louis, MO, Code No. M-6250) were used for the assay.

3) Test compounds

Each test compound dissolved in DMSO (Nacalai Tesque (Kyoto) code No. 11J) at a concentration of 100mM was diluted to final concentration with the medium.

4) Sensitization and preparation of lymph node cells

KLM (0.2mg) was subcutaneously administered to mouse foot with Freund's complete adjuvant (Difco Lab., Detroit, Michigan, Code No. 3113-60-5). Ten days later popliteal lymph node was picked up and its cell suspension was prepared.

5) Production of cytokine by stimulation with an antigen

KLH (0.1mg/ml) and the drug were added to lymph node cells (5×10^6 cells/ml) and the mixture was incubated at 37°C under 5% CO₂ for 4 days (Corning 25850, 0.15ml/well). Then amount of cytokine produced in the supernatant was measured by ELISA specific to cytokine.

Amounts of interleukin 4 (IL-4) and interleukin 5 (IL-5) as a typical Th2 type cytokine, and interferon γ (IFN- γ) as a typical Th1 type cytokine were measured.

[0161]

6) Method of measurement (ELISA)

Amount of IL-4 was measured by ELISA as mentioned below. A rat anti-mouse IL-4 antibody (Pharmingen, San Diego, CA, Code No. 18031D, 0.5mg/ml) as a primary antibody was diluted 250 times with hydrogen carbonate buffer, and

it was seeded to the 96-well plate (Falcon 3912, Becton Dickinson and Company, Franklin Lakes, NJ) (50ml/well) and each well was coated at 4°C overnight. Then the plate was blocked with PBS (-) solution containing 3% BSA (200ml/well). After rinsing and drying the plate, the plate was stored at -20°C until beginning to use. The supernatant of the culture medium was added to the wells (50ml/well) and the plate was incubated at room temperature for 4 hours. Recombinant mouse IL-4 (Pharmingen, Code No. 19231W) was used for preparing a calibration curve.

After rinsing the plate, a rat anti-mouse IL-4 antibody labeled by biotin (Pharmingen, Code No. 18042D, 0.5mg/ml) as a secondary antibody, which was diluted 500 times with PBS (-) solution containing 0.1% BSA, was poured into wells (100ml/well). The plate was incubated at room temperature. The secondary antibody bound to the plate was detected with streptoabidin alkaliphosphatase (Kirkegaard & Perry Lab., Gaithersburg, MD, Code No. 15-30-00) (0.25mg/ml, 10ml/well). After incubation at 37°C for 1 hour and rinsing of the plate, the coloring was done by adding p-nitrophenyl disodium phosphate substrate (Nacalai Tesque) (1mg/ml, 100ml/well). The absorption at 415nm was measured by a microplate reader (MTP-120 Microplatereader, Corona Electric Co.)

same method as mentioned above by using a rat anti-mouse IFN- γ antibody (Pharmingen, San Diego, CA, Code No. 18181D, 0.5mg/ml) as a primary antibody and a rat anti-mouse IFN- γ antibody labeled by biotin (Pharmingen, Code No. 18112D, 0.5mg/ml) as a secondary antibody. Recombinant mouse IFN- γ (Pharmingen, Code No. 19301U) was used for preparing a calibration curve.

Measurement of amounts of IL-5 was carried out in the same method as mentioned above by using a rat anti-mouse IL-5 antibody (Pharmingen, San Diego, CA, Code No. 18051D, 0.5mg/ml) as a primary antibody and a rat anti-mouse IL-5 antibody labeled by biotin (Pharmingen, Code No. 18062D, 0.5mg/ml) as a secondary antibody. Recombinant mouse IL-5 (Pharmingen, Code No. 19241W) was used for preparing a calibration curve. The test was carried out three times and their average was calculated.
